

THE AGENTIC TRADING FRONTIER

MarketDeck Brief / Fieldnotes 02 / September 2026

AI strategies, multi-agent systems, live evidence and risk.

Research and education. Not investment advice.

THE TRADING STACK IS BECOMING A TEAM

2026 systems increasingly split evidence, quant, narrative and risk jobs.

Specialist agents are useful when handoffs and data contracts are explicit.

The agent is the whole decision loop; the LLM is one component.

SPECIALISTS NEED CLEAR HANDOFFS

Evidence agents retrieve. Quant tools calculate. Risk layers constrain.

Coordinators should compare competing evidence instead of merely voting.

Deterministic code remains the best home for arithmetic and hard limits.

EVOLVE THE PLAYBOOK, NOT ONLY THE WEIGHTS

EvolveTrade treats the agent procedure itself as an adaptable policy.

Decision traces and realized feedback can change tool use and verification.

Policy versioning, rollback and out-of-sample checks become essential.

THE HYBRID PATTERN

Fin-Analyst combined LLM specialists with rule-based signals.

The promising pattern separates reasoning, state, risk and execution.

Short live windows remain noisy; rankings can reverse quickly.

A PROFITABLE BACKTEST CAN STILL BE A BAD BEN

KTD-Fin masks identifiers and dates to reduce historical-memory leakage.

It also attributes returns to market, style and stock-selection components.

Reported profits are not enough; researchers need to know where they came from.

WHAT PRODUCTION AGENTS ACTUALLY DO

A September 2026 study recorded thousands of real-money agent deployments.

Operating-layer choices, risk settings and prompt-visible rankings shaped behavior.

Interface, state and execution design are part of the realized strategy.

THE NEXT EDGE MAY BE TRUSTWORTHY AUTONO

Adversarial inputs can propagate through multi-agent trading stacks.

Bounded authority, reconciled state, provenance and kill paths are core controls.

The frontier is moving from can an agent trade to can it be trusted.
